Chapter 1

Overview

The libspe2 functionality is split into 4 libraries:

- **libspe-base** This library provides the basic infrastructure to manage and use SPEs. The central data structure is a SPE context [spe_context](#). It contains all information necessary to manage an SPE, run code on it, communicate with it, and so on. To use the libspe-base library, the header file [spebase.h](#) has to be included and an application needs to link against **libspebase.a** or **libspebase.so**.
- **libspe-event** This is a convenience library for the handling of events generated by an SPE. It is based on libspe-base and epoll. Since the [spe_context](#) introduced by libspe-base contains the file descriptors to mailboxes etc, any other event handling mechanism could also be implemented based on libspe-base.

1.1 Terminology

- **main thread** usually the application main thread running on a PPE
- **SPE thread** a thread that uses SPEs. Execution starts on the PPE. Execution shifts between PPE and an SPE back and fro, e.g., PPE services system calls for SPE transparently

1.2 Usage Scenarios

1.2.1 Single-threaded sample

Note: In the new model, it is not necessary to have a main thread - the SPE thread can be the only application thread. It may run parts of its code on PPE and then start an SPE, e.g., for an accelerated function. The main thread is needed only if you want to use multiple SPEs concurrently. The following minimalistic sample illustrates the basic steps:

Figure 1.1: Simple program

Here is the same sample with some error checking:

1.2.2 Multi-threaded sample

This illustrates a threaded sample using the pthread library:

Figure 1.2: Simple pthread program

Here is the same sample with some error checking:

1.2.3 Problem state mapping samples

This illustrates accessing the MFC Local Store Address Register.

1.2.4 Event samples

This illustrates a sample using the event library. The event, which we receive is of course that the spu program has stopped, because otherwise we would not get there.

Events are more useful in multithreaded environments:

Chapter 2

Data Structure Documentation

2.1 addr64 Union Reference

```
#include <elf_loader.h>
```

Collaboration diagram for addr64:

Data Fields

- unsigned long long [ull](#)
- unsigned int [ui](#) [2]

2.1.1 Detailed Description

Definition at line 28 of file `elf_loader.h`.

2.1.2 Field Documentation

unsigned int `ui`[2]

Definition at line 31 of file `elf_loader.h`.

Referenced by `_base_spe_context_run()`.

unsigned long long ull

Definition at line 30 of file elf_loader.h.

Referenced by `_base_spe_context_run()`.

The documentation for this union was generated from the following file:

- [elf_loader.h](#)

2.2 fd_attr Struct Reference

Collaboration diagram for fd_attr:

Data Fields

- `const char *` [name](#)
- `int` [mode](#)

2.2.1 Detailed Description

Definition at line 37 of file create.c.

2.2.2 Field Documentation

int mode

Definition at line 39 of file create.c.

Referenced by `_base_spe_open_if_closed()`.

const char* name

Definition at line 38 of file create.c.

Referenced by `_base_spe_open_if_closed()`.

The documentation for this struct was generated from the following file:

- [create.c](#)

2.3 image_handle Struct Reference

Collaboration diagram for image_handle:

Data Fields

- [spe_program_handle_t speh](#)
- unsigned int [map_size](#)

2.3.1 Detailed Description

Definition at line 32 of file `image.c`.

2.3.2 Field Documentation

unsigned int `map_size`

Definition at line 34 of file `image.c`.

Referenced by `_base_spe_image_close()`, and `_base_spe_image_open()`.

`spe_program_handle_t speh`

Definition at line 33 of file `image.c`.

Referenced by `_base_spe_image_close()`, and `_base_spe_image_open()`.

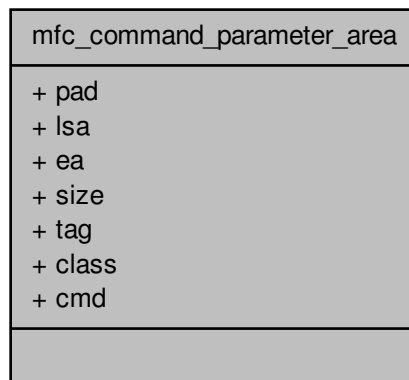

The documentation for this struct was generated from the following file:

- [image.c](#)

2.4 mfc_command_parameter_area Struct Reference

```
#include <dma.h>
```

Collaboration diagram for mfc_command_parameter_area:

Data Fields

- `uint32_t` [pad](#)
- `uint32_t` [lsa](#)
- `uint64_t` [ea](#)
- `uint16_t` [size](#)
- `uint16_t` [tag](#)
- `uint16_t` [class](#)
- `uint16_t` [cmd](#)

2.4.1 Detailed Description

Definition at line 27 of file `dma.h`.

2.4.2 Field Documentation

`uint16_t` class

Definition at line 33 of file `dma.h`.

`uint16_t` cmd

Definition at line 34 of file `dma.h`.

`uint64_t` ea

Definition at line 30 of file `dma.h`.

uint32_t lsa

Definition at line 29 of file dma.h.

uint32_t pad

Definition at line 28 of file dma.h.

uint16_t size

Definition at line 31 of file dma.h.

uint16_t tag

Definition at line 32 of file dma.h.

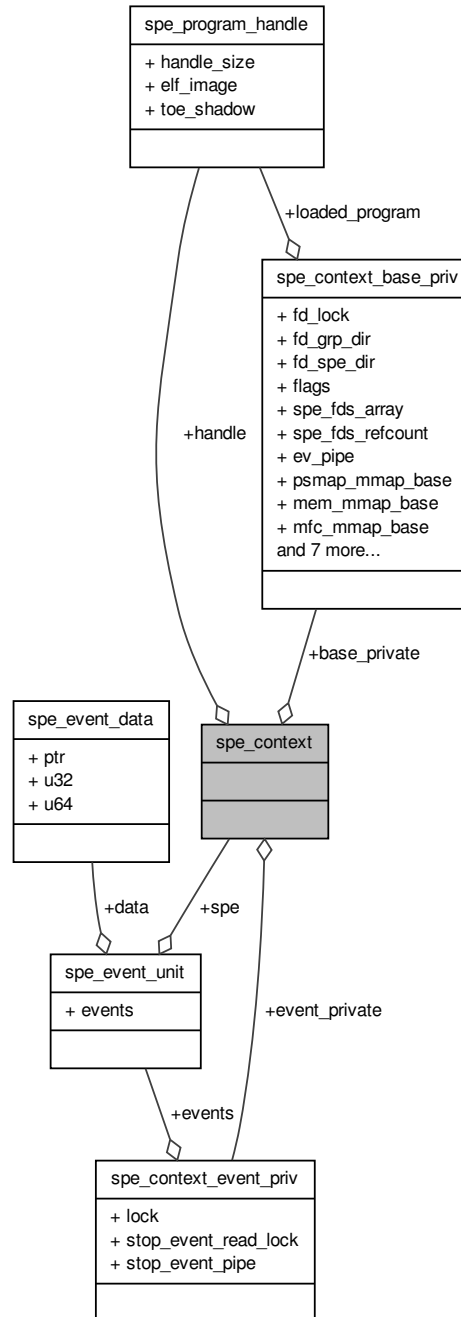

The documentation for this struct was generated from the following file:

- [dma.h](#)

2.5 spe_context Struct Reference

```
#include <libspe2-types.h>
```

Collaboration diagram for `spe_context`:

Data Fields

- `spe_program_handle_t handle`
- `struct spe_context_base_priv * base_private`

- `struct spe_context_event_priv * event_private`

2.5.1 Detailed Description

SPE context The SPE context is one of the base data structures for the libspe2 implementation. It holds all persistent information about a "logical SPE" used by the application. This data structure should not be accessed directly, but the application uses a pointer to an SPE context as an identifier for the "logical SPE" it is dealing with through libspe2 API calls.

Definition at line 64 of file `libspe2-types.h`.

2.5.2 Field Documentation

`struct spe_context_base_priv * base_private`

Definition at line 76 of file `libspe2-types.h`.

Referenced by `_base_spe_spe_dir_get()`, `_base_spe_stop_event_source_get()`, `_base_spe_stop_event_target_get()`, `_base_spe_close_if_open()`, `_base_spe_context_create()`, `_base_spe_context_lock()`, `_base_spe_context_run()`, `_base_spe_context_unlock()`, `_base_spe_handle_library_callback()`, `_base_spe_in_mbox_status()`, `_base_spe_in_mbox_write()`, `_base_spe_ls_area_get()`, `_base_spe_mfcio_tag_status_read()`, `_base_spe_mssync_start()`, `_base_spe_mssync_status()`, `_base_spe_open_if_closed()`, `_base_spe_out_intr_mbox_status()`, `_base_spe_out_mbox_read()`, `_base_spe_out_mbox_status()`, `_base_spe_program_load()`, `_base_spe_program_load_complete()`, `_base_spe_ps_area_get()`, `_base_spe_signal_write()`, and `_event_spe_event_handler_register()`.

`struct spe_context_event_priv * event_private`

Definition at line 77 of file `libspe2-types.h`.

`spe_program_handle_t handle`

Definition at line 72 of file `libspe2-types.h`.

The documentation for this struct was generated from the following file:

- `libspe2-types.h`

2.6 `spe_context_base_priv` Struct Reference

```
#include <spebase.h>
```

Collaboration diagram for `spe_context_base_priv`:

Data Fields

- `pthread_mutex_t fd_lock [NUM_MBOX_FDS]`
- `int fd_grp_dir`
- `int fd_spe_dir`
- `unsigned int flags`
- `int spe_fds_array [NUM_MBOX_FDS]`
- `int spe_fds_refcount [NUM_MBOX_FDS]`
- `int ev_pipe [2]`
- `void * psmap_mmap_base`
- `void * mem_mmap_base`
- `void * mfc_mmap_base`
- `void * mssync_mmap_base`
- `void * cntl_mmap_base`

- void * [signal1_mmap_base](#)
- void * [signal2_mmap_base](#)
- int [entry](#)
- [spe_program_handle_t](#) * [loaded_program](#)
- int [emulated_entry](#)
- int [active_tagmask](#)

2.6.1 Detailed Description

Definition at line 61 of file `spebase.h`.

2.6.2 Field Documentation

int active_tagmask

Definition at line 108 of file `spebase.h`.

Referenced by `_base_spe_mfcio_tag_status_read()`.

void* cntl_mmap_base

Definition at line 88 of file `spebase.h`.

Referenced by `_base_spe_context_create()`, `_base_spe_in_mbox_status()`, `_base_spe_out_intr_mbox_status()`, `_base_spe_out_mbox_status()`, and `_base_spe_ps_area_get()`.

int emulated_entry

Definition at line 103 of file `spebase.h`.

Referenced by `_base_spe_context_run()`, and `_base_spe_program_load()`.

int entry

Definition at line 93 of file `spebase.h`.

Referenced by `_base_spe_context_run()`, and `_base_spe_program_load()`.

int ev_pipe[2]

Definition at line 81 of file `spebase.h`.

Referenced by `_base_spe_stop_event_source_get()`, and `_base_spe_stop_event_target_get()`.

int fd_grp_dir

Definition at line 68 of file `spebase.h`.

pthread_mutex_t fd_lock[NUM_MBOX_FDS]

Definition at line 65 of file `spebase.h`.

Referenced by `_base_spe_context_create()`, `_base_spe_context_lock()`, and `_base_spe_context_unlock()`.

int fd_spe_dir

Definition at line 71 of file `spebase.h`.

Referenced by `_base_spe_spe_dir_get()`, `_base_spe_context_create()`, `_base_spe_context_run()`, `_base_spe_open_if_closed()`, and `_base_spe_program_load_complete()`.

unsigned int flags

Definition at line 74 of file spebase.h.

Referenced by `_base_spe_context_create()`, `_base_spe_context_run()`, `_base_spe_handle_library_callback()`, `_base_spe_in_mbox_status()`, `_base_spe_in_mbox_write()`, `_base_spe_mfcio_tag_status_read()`, `_base_spe_mssync_start()`, `_base_spe_mssync_status()`, `_base_spe_out_intr_mbox_status()`, `_base_spe_out_mbox_read()`, `_base_spe_out_mbox_status()`, `_base_spe_program_load()`, `_base_spe_signal_write()`, and `_event_spe_event_handler_register()`.

spe_program_handle_t* loaded_program

Definition at line 99 of file spebase.h.

Referenced by `_base_spe_context_create()`, `_base_spe_program_load()`, and `_base_spe_program_load_complete()`.

void* mem_mmap_base

Definition at line 85 of file spebase.h.

Referenced by `_base_spe_context_create()`, `_base_spe_context_run()`, `_base_spe_handle_library_callback()`, `_base_spe_ls_area_get()`, and `_base_spe_program_load()`.

void* mfc_mmap_base

Definition at line 86 of file spebase.h.

Referenced by `_base_spe_context_create()`, and `_base_spe_ps_area_get()`.

void* mssync_mmap_base

Definition at line 87 of file spebase.h.

Referenced by `_base_spe_context_create()`, `_base_spe_mssync_start()`, `_base_spe_mssync_status()`, and `_base_spe_ps_area_get()`.

void* psmap_mmap_base

Definition at line 84 of file spebase.h.

Referenced by `_base_spe_context_create()`.

void* signal1_mmap_base

Definition at line 89 of file spebase.h.

Referenced by `_base_spe_context_create()`, `_base_spe_ps_area_get()`, and `_base_spe_signal_write()`.

void* signal2_mmap_base

Definition at line 90 of file spebase.h.

Referenced by `_base_spe_context_create()`, `_base_spe_ps_area_get()`, and `_base_spe_signal_write()`.

int spe_fds_array[NUM_MBOX_FDS]

Definition at line 77 of file spebase.h.

Referenced by `_base_spe_close_if_open()`, `_base_spe_context_create()`, and `_base_spe_open_if_closed()`.

```
int spe_fds_refcount[NUM_MBOX_FDS]
```

Definition at line 78 of file spebase.h.

Referenced by `_base_spe_close_if_open()`, and `_base_spe_open_if_closed()`.

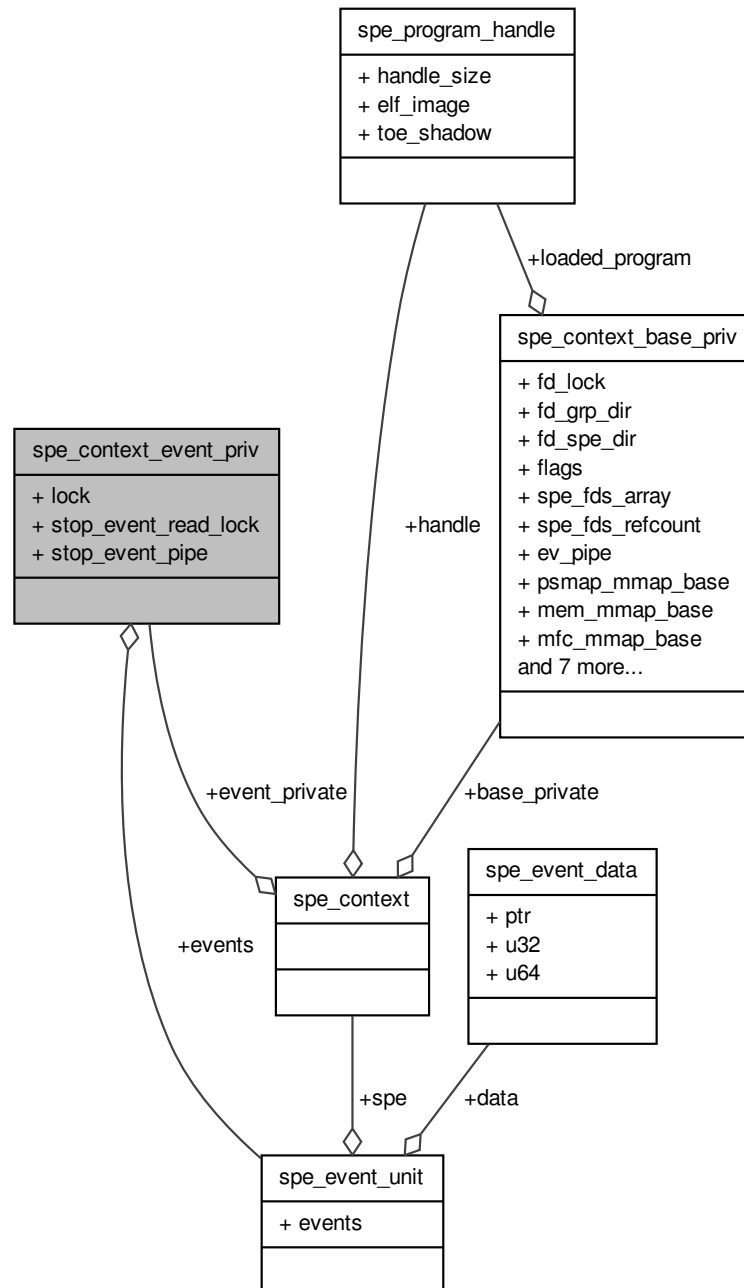

The documentation for this struct was generated from the following file:

- [spebase.h](#)

2.7 `spe_context_event_priv` Struct Reference

```
#include <speevent.h>
```

Collaboration diagram for `spe_context_event_priv`:

Data Fields

- `pthread_mutex_t` [lock](#)
- `pthread_mutex_t` [stop_event_read_lock](#)

- [int stop_event_pipe](#) [2]
- [spe_event_unit_t events](#) [__NUM_SPE_EVENT_TYPES]

2.7.1 Detailed Description

Definition at line 35 of file speevent.h.

2.7.2 Field Documentation

spe_event_unit_t events[__NUM_SPE_EVENT_TYPES]

Definition at line 40 of file speevent.h.

Referenced by `_event_spe_context_initialize()`, `_event_spe_event_handler_deregister()`, and `_event_spe_event_handler_register()`.

pthread_mutex_t lock

Definition at line 37 of file speevent.h.

Referenced by `_event_spe_context_finalize()`, and `_event_spe_context_initialize()`.

int stop_event_pipe[2]

Definition at line 39 of file speevent.h.

Referenced by `_event_spe_context_finalize()`, `_event_spe_context_initialize()`, `_event_spe_context_run()`, `_event_spe_event_handler_deregister()`, `_event_spe_event_handler_register()`, and `_event_spe_stop_info_read()`.

pthread_mutex_t stop_event_read_lock

Definition at line 38 of file speevent.h.

Referenced by `_event_spe_context_finalize()`, `_event_spe_context_initialize()`, and `_event_spe_stop_info_read()`.

The documentation for this struct was generated from the following file:

- [speevent.h](#)

2.8 spe_context_info Struct Reference

Collaboration diagram for `spe_context_info`:

Data Fields

- int [spe_id](#)
- unsigned int [npc](#)
- unsigned int [status](#)
- struct [spe_context_info](#) * [prev](#)

2.8.1 Detailed Description

Definition at line 40 of file run.c.

2.8.2 Field Documentation

unsigned int npc

Definition at line 42 of file run.c.

Referenced by `_base_spe_context_run()`.

struct spe_context_info* prev

Definition at line 44 of file run.c.

Referenced by `_base_spe_context_run()`.

int spe_id

Definition at line 41 of file run.c.

Referenced by `_base_spe_context_run()`.

unsigned int status

Definition at line 43 of file run.c.

Referenced by `_base_spe_context_run()`.

The documentation for this struct was generated from the following file:

- [run.c](#)

2.9 spe_event_data Union Reference

```
#include <libspe2-types.h>
```

Collaboration diagram for `spe_event_data`:

Data Fields

- void * [ptr](#)
- unsigned int [u32](#)
- unsigned long long [u64](#)

2.9.1 Detailed Description

`spe_event_data_t` User data to be associated with an event
 Definition at line 143 of file `libspe2-types.h`.

2.9.2 Field Documentation

void* ptr

Definition at line 145 of file `libspe2-types.h`.
 Referenced by `_event_spe_event_handler_register()`.

unsigned int u32

Definition at line 146 of file `libspe2-types.h`.

unsigned long long u64

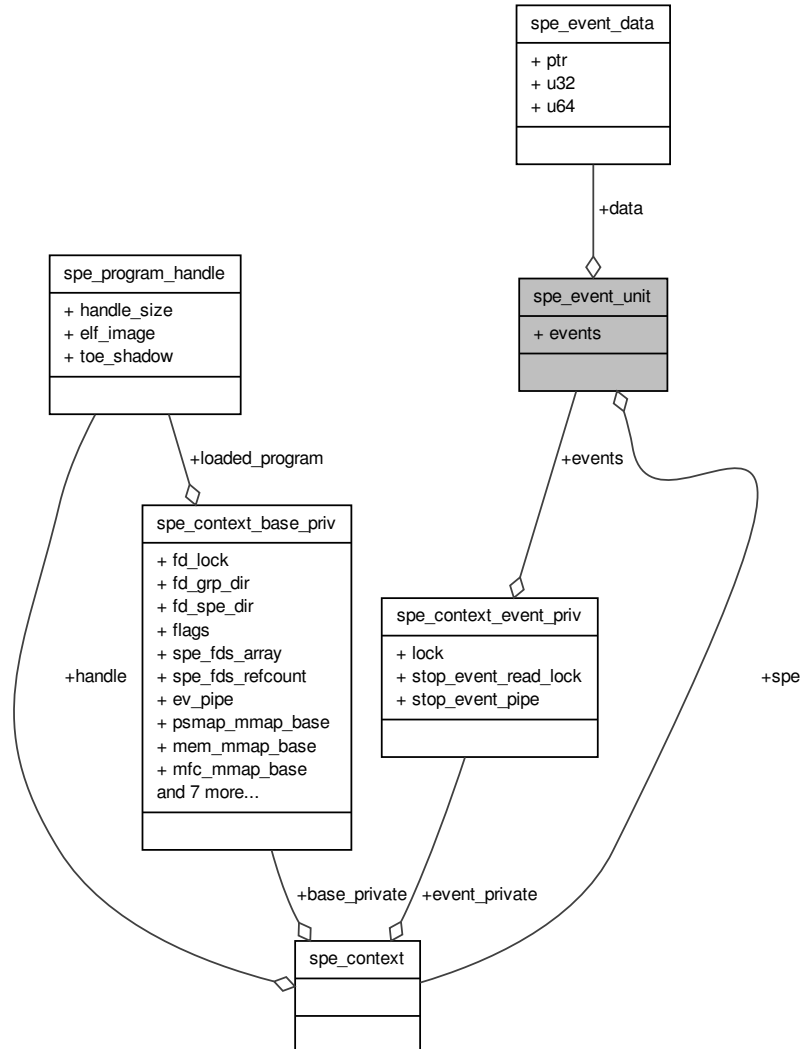

Definition at line 147 of file `libspe2-types.h`.
 The documentation for this union was generated from the following file:

- [libspe2-types.h](#)

2.10 spe_event_unit Struct Reference

```
#include <libspe2-types.h>
```

Collaboration diagram for `spe_event_unit`:

Data Fields

- unsigned int `events`
- `spe_context_ptr_t spe`
- `spe_event_data_t data`

2.10.1 Detailed Description

`spe_event_t`

Definition at line 152 of file `libspe2-types.h`.

2.10.2 Field Documentation

spe_event_data_t data

Definition at line 156 of file libspe2-types.h.

Referenced by `_event_spe_event_handler_register()`.

unsigned int events

Definition at line 154 of file libspe2-types.h.

Referenced by `_event_spe_event_handler_deregister()`, and `_event_spe_event_handler_register()`.

spe_context_ptr_t spe

Definition at line 155 of file libspe2-types.h.

Referenced by `_event_spe_context_initialize()`, `_event_spe_event_handler_deregister()`, `_event_spe_event_handler_register()`, and `_event_spe_event_wait()`.

The documentation for this struct was generated from the following file:

- [libspe2-types.h](#)

2.11 spe_gang_context Struct Reference

```
#include <libspe2-types.h>
```

Collaboration diagram for `spe_gang_context`:

Data Fields

- struct `spe_gang_context_base_priv` * `base_private`

- struct
spe_gang_context_event_priv * [event_private](#)

2.11.1 Detailed Description

SPE gang context The SPE gang context is one of the base data structures for the libspe2 implementation. It holds all persistent information about a group of SPE contexts that should be treated as a gang, i.e., be execute together with certain properties. This data structure should not be accessed directly, but the application uses a pointer to an SPE gang context as an identifier for the SPE gang it is dealing with through libspe2 API calls.

Definition at line 94 of file libspe2-types.h.

2.11.2 Field Documentation

struct spe_gang_context_base_priv* base_private

Definition at line 99 of file libspe2-types.h.

Referenced by `_base_spe_context_create()`, and `_base_spe_gang_context_create()`.

struct spe_gang_context_event_priv* event_private

Definition at line 100 of file libspe2-types.h.

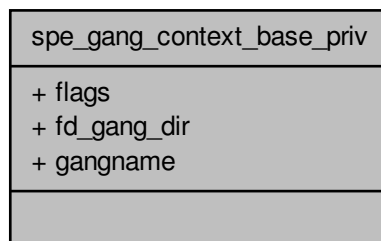

The documentation for this struct was generated from the following file:

- [libspe2-types.h](#)

2.12 spe_gang_context_base_priv Struct Reference

```
#include <spebase.h>
```

Collaboration diagram for `spe_gang_context_base_priv`:

Data Fields

- unsigned int [flags](#)
- int [fd_gang_dir](#)
- char [gangname](#) [256]

2.12.1 Detailed Description

[spe_context](#): This holds the persistent information of a SPU instance it is created by `spe_create_context()`
 Definition at line 150 of file `spebase.h`.

2.12.2 Field Documentation

int fd_gang_dir

Definition at line 156 of file `spebase.h`.

unsigned int flags

Definition at line 153 of file `spebase.h`.

char gangname[256]

Definition at line 158 of file `spebase.h`.

Referenced by `_base_spe_context_create()`, and `_base_spe_gang_context_create()`.

The documentation for this struct was generated from the following file:

- [spebase.h](#)

2.13 `spe_ld_info` Struct Reference

```
#include <elf_loader.h>
```

Collaboration diagram for `spe_ld_info`:

Data Fields

- unsigned int [entry](#)

2.13.1 Detailed Description

Definition at line 34 of file `elf_loader.h`.

2.13.2 Field Documentation

unsigned int entry

Definition at line 36 of file elf_loader.h.

Referenced by `_base_spe_load_spe_elf()`, and `_base_spe_program_load()`.

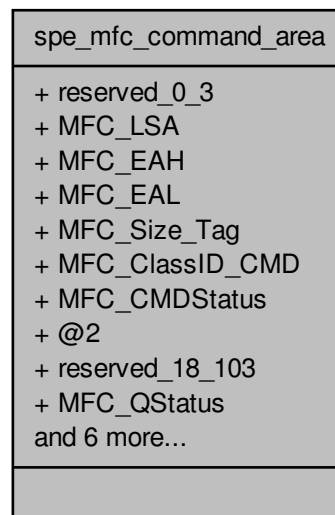

The documentation for this struct was generated from the following file:

- [elf_loader.h](#)

2.14 spe_mfc_command_area Struct Reference

```
#include <cbea_map.h>
```

Collaboration diagram for `spe_mfc_command_area`:

Data Fields

- unsigned char [reserved_0_3](#) [4]
- unsigned int [MFC_LSA](#)
- unsigned int [MFC_EAH](#)
- unsigned int [MFC_EAL](#)
- unsigned int [MFC_Size_Tag](#)
- union {

77 }
```

Here is the call graph for this function:

`void __base_spe_event_source_release (struct spe_context * spectx, enum fd_name fdesc)`

`__base_spe_event_source_release` releases the file descriptor to the specified event source

Parameters

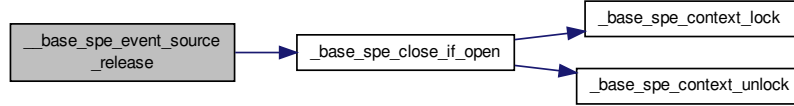

<i>spectx</i>	Specifies the SPE context
<i>fdesc</i>	Specifies the event source

Definition at line 79 of file `accessors.c`.

References `_base_spe_close_if_open()`.

```
80 {
81     _base_spe_close_if_open(spe, fdesc);
82 }
```

Here is the call graph for this function:

int __base_spe_dir_get (spe_context_ptr_t spe)

Definition at line 84 of file accessors.c.

References spe_context::base_private, and spe_context_base_priv::fd_spe_dir.

```

85 {
86     return spe->base_private->fd_spe_dir;
87 }
```

int __base_spe_stop_event_source_get (spe_context_ptr_t spe)

speevent users read from this end

Definition at line 92 of file accessors.c.

References spe_context::base_private, and spe_context_base_priv::ev_pipe.

```

93 {
94     return spe->base_private->ev_pipe[1];
95 }
```

int __base_spe_stop_event_target_get (spe_context_ptr_t spe)

speevent writes to this end

Definition at line 100 of file accessors.c.

References spe_context::base_private, and spe_context_base_priv::ev_pipe.

```

101 {
102     return spe->base_private->ev_pipe[0];
103 }
```

void* __base_spe_ls_area_get (spe_context_ptr_t spe)

Definition at line 64 of file accessors.c.

References spe_context::base_private, and spe_context_base_priv::mem_mmap_base.

```

65 {
66     return spe->base_private->mem_mmap_base;
67 }
```

int __base_spe_ls_size_get (spe_context_ptr_t spe)

__base_spe_ls_size_get returns the size of the local store area

Parameters

<i>spectx</i>	Specifies the SPE context
---------------	---------------------------

Definition at line 105 of file accessors.c.

References LS_SIZE.

```

106 {
107     return LS_SIZE;
108 }
```

3.6.1 Function Documentation

`int _base_spe_mfcio_get (spe_context_ptr_t spectx, unsigned int ls, void * ea, unsigned int size, unsigned int tag, unsigned int tid, unsigned int rid)`

The `_base_spe_mfcio_get` function places a get DMA command on the proxy command queue of the SPE thread specified by `speid`. The get command transfers `size` bytes of data starting at the effective address specified by `ea` to the local store address specified by `ls`. The DMA is identified by the tag id specified by `tag` and performed according to the transfer class and replacement class specified by `tid` and `rid` respectively. Parameters

<i>spectx</i>	Specifies the SPE context
<i>ls</i>	Specifies the starting local store destination address.
<i>ea</i>	Specifies the starting effective address source address.
<i>size</i>	Specifies the size, in bytes, to be transferred.
<i>tag</i>	Specifies the tag id used to identify the DMA command.
<i>tid</i>	Specifies the transfer class identifier of the DMA command.
<i>rid</i>	Specifies the replacement class identifier of the DMA command.

Returns

On success, return 0. On failure, -1 is returned.

Definition at line 160 of file `dma.c`.

References `MFC_CMD_GET`.

```

167 {
168     return spe_do_mfc_get(spectx, ls, ea, size, tag, tid, rid, MFC_CMD_GET);
169 }
```

`int _base_spe_mfcio_getb (spe_context_ptr_t spectx, unsigned int ls, void * ea, unsigned int size, unsigned int tag, unsigned int tid, unsigned int rid)`

The `_base_spe_mfcio_getb` function is identical to `_base_spe_mfcio_get` except that it places a `getb` (get with barrier) DMA command on the proxy command queue. The barrier form ensures that this command and all sequence commands with the same tag identifier as this command are locally ordered with respect to all previously issued commands with the same tag group and command queue.

Parameters

<i>spectx</i>	Specifies the SPE context
<i>ls</i>	Specifies the starting local store destination address.
<i>ea</i>	Specifies the starting effective address source address.
<i>size</i>	Specifies the size, in bytes, to be transferred.
<i>tag</i>	Specifies the tag id used to identify the DMA command.
<i>tid</i>	Specifies the transfer class identifier of the DMA command.
<i>rid</i>	Specifies the replacement class identifier of the DMA command.

Returns

On success, return 0. On failure, -1 is returned.

Definition at line 171 of file dma.c.

References MFC_CMD_GETB.

```

178 {
179     return spe_do_mfc_get(spectx, ls, ea, size, tag, rid, rid, MFC_CMD_GETB);
180 }
```

int _base_spe_mfcio_getf (*spe_context_ptr_t spectx*, unsigned int *ls*, void * *ea*, unsigned int *size*, unsigned int *tag*, unsigned int *tid*, unsigned int *rid*)

The `_base_spe_mfcio_getf` function is identical to `_base_spe_mfcio_get` except that it places a getf (get with fence) DMA command on the proxy command queue. The fence form ensure that this command is locally ordered with respect to all previously issued commands with the same tag group and command queue.

Parameters

<i>spectx</i>	Specifies the SPE context
<i>ls</i>	Specifies the starting local store destination address.
<i>ea</i>	Specifies the starting effective address source address.
<i>size</i>	Specifies the size, in bytes, to be transferred.
<i>tag</i>	Specifies the tag id used to identify the DMA command.
<i>tid</i>	Specifies the transfer class identifier of the DMA command.
<i>rid</i>	Specifies the replacement class identifier of the DMA command.

Returns

On success, return 0. On failure, -1 is returned.

Definition at line 182 of file dma.c.

References MFC_CMD_GETF.

```

189 {
190     return spe_do_mfc_get(spectx, ls, ea, size, tag, tid, rid, MFC_CMD_GETF);
191 }
```

int _base_spe_mfcio_put (*spe_context_ptr_t spectx*, unsigned int *ls*, void * *ea*, unsigned int *size*, unsigned int *tag*, unsigned int *tid*, unsigned int *rid*)

The `_base_spe_mfcio_put` function places a put DMA command on the proxy command queue of the SPE thread specified by `speid`. The put command transfers `size` bytes of data starting at the local store address specified by `ls` to the effective address specified by `ea`. The DMA is identified by the tag id specified by `tag` and performed according transfer class and replacement class specified by `tid` and `rid` respectively.

Parameters

<i>spectx</i>	Specifies the SPE context
<i>ls</i>	Specifies the starting local store destination address.
<i>ea</i>	Specifies the starting effective address source address.
<i>size</i>	Specifies the size, in bytes, to be transferred.
<i>tag</i>	Specifies the tag id used to identify the DMA command.
<i>tid</i>	Specifies the transfer class identifier of the DMA command.
<i>rid</i>	Specifies the replacement class identifier of the DMA command.

Returns

On success, return 0. On failure, -1 is returned.

Definition at line 126 of file dma.c.

145     return spe_do_mfc_put(spectx, ls, ea, size, tag, tid, rid, MFC_CMD_PUTB);
146 }
```

int _base_spe_mfcio_putf (spe_context_ptr_t spectx, unsigned int ls, void * ea, unsigned int size, unsigned int tag, unsigned int tid, unsigned int rid)

The _base_spe_mfcio_putf function is identical to _base_spe_mfcio_put except that it places a putf (put with fence) DMA command on the proxy command queue. The fence form ensures that this command is locally ordered with respect to all previously issued commands with the same tag group and command queue.

Parameters

<i>spectx</i>	Specifies the SPE context
<i>ls</i>	Specifies the starting local store destination address.
<i>ea</i>	Specifies the starting effective address source address.
<i>size</i>	Specifies the size, in bytes, to be transferred.
<i>tag</i>	Specifies the tag id used to identify the DMA command.
<i>tid</i>	Specifies the transfer class identifier of the DMA command.
<i>rid</i>	Specifies the replacement class identifier of the DMA command.

Returns

On success, return 0. On failure, -1 is returned.

Functions

- [spe_program_handle_t * _base_spe_image_open](#) (const char *filename)
- [int _base_spe_image_close](#) ([spe_program_handle_t](#) *handle)

3.11.1 Function Documentation

int _base_spe_image_close (spe_program_handle_t * *handle*)

_base_spe_image_close unmaps an SPE ELF object that was previously mapped using spe_open_image.

Parameters

<i>handle</i>	handle to open file
---------------	---------------------

Return values

0	On success, spe_close_image returns 0.
-1	On failure, -1 is returned and errno is set appropriately. Possible values for errno: EINVAL From spe_close_image, this indicates that the file, specified by filename, was not previously mapped by a call to spe_open_image.

Definition at line 96 of file image.c.

References spe_program_handle::elf_image, image_handle::map_size, image_handle::speh, and spe_program_handle::toe_shadow.

```

97 {
98     int ret = 0;
99     struct image_handle *ih;
100
101     if (!handle) {
102         errno = EINVAL;
103         return -1;
104     }
105
106     ih = (struct image_handle *)handle;
107
108     if (!ih->speh.elf_image || !ih->map_size) {
109         errno = EINVAL;
110         return -1;
111     }
112
113     if (ih->speh.toe_shadow)
114         free(ih->speh.toe_shadow);
115
116     ret = munmap(ih->speh.elf_image, ih->map_size );
117     free(handle);
118
119     return ret;
120 }
```

spe_program_handle_t* _base_spe_image_open (const char *filename)

_base_spe_image_open maps an SPE ELF executable indicated by filename into system memory and returns the mapped address appropriate for use by the spe_create_thread API. It is often more convenient/appropriate to use the loading methodologies where SPE ELF objects are converted to PPE static or shared libraries with symbols which point to the SPE ELF objects after these special libraries are loaded. These libraries are then linked with the associated PPE code to provide a direct symbol reference to the SPE ELF object. The symbols in this scheme are equivalent to the address returned from the spe_open_image function. SPE ELF objects loaded using this function are not shared with other processes, but SPE ELF objects loaded using the other scheme, mentioned above, can be shared if so desired.

Parameters

<i>filename</i>	Specifies the filename of an SPE ELF executable to be loaded and mapped into system memory.
-----------------	---

Returns

On success, spe_open_image returns the address at which the specified SPE ELF object has been mapped. On failure, NULL is returned and errno is set appropriately.

Possible values for errno include:

EACCES The calling process does not have permission to access the specified file.

EFAULT The filename parameter points to an address that was not contained in the calling process's address space.

A number of other `errno` values could be returned by the `open(2)`, `fstat(2)`, `mmap(2)`, `munmap(2)`, or `close(2)` system calls which may be utilized by the `spe_open_image` or `spe_close_image` functions.

3.19.1 Function Documentation

int _base_spe_in_mbox_status (spe_context_ptr_t spectx)

The `_base_spe_in_mbox_status` function fetches the status of the SPU inbound mailbox for the SPE thread specified by the `speid` parameter. A 0 value is return if the mailbox is full. A non-zero value specifies the number of available (32-bit) mailbox entries.

Parameters

<i>spectx</i>	Specifies the SPE context whose mailbox status is to be read.
---------------	---

Returns

On success, returns the current status of the mailbox, respectively. On failure, -1 is returned.

Here is the call graph for this function:

int _base_spe_out_mbox_read (spe_context_ptr_t spectx, unsigned int mbox_data[], int count)

The `_base_spe_out_mbox_read` function reads the contents of the SPE outbound interrupting mailbox for the SPE thread speid.

The call will not block until the read request is satisfied, but instead return up to count currently available mailbox entries.

`spe_stat_out_intr_mbox` can be called to ensure that data is available prior to reading the outbound interrupting mailbox.

Parameters

<i>spectx</i>	Specifies the SPE thread whose outbound mailbox is to be read.
<i>mbox_data</i>	
<i>count</i>	

Return values

<i>>0</i>	the number of 32-bit mailbox messages read
<i>=0</i>	no data available
<i>-1</i>	error condition and errno is set Possible values for errno: EINVAL speid is invalid Exxxx what else do we need??

```

Here is the call graph for this function:

**int _base_spe_signal_write (spe_context_ptr_t spectx, unsigned int signal_reg, unsigned int data)**

The `_base_spe_signal_write` function writes data to the signal notification register specified by `signal_reg` for the SPE thread specified by the `speid` parameter.

Parameters

<i>spectx</i>	Specifies the SPE context whose signal register is to be written to.
<i>signal_reg</i>	Specified the signal notification register to be written. Valid signal notification registers are: SPE.SIG_NOTIFY_REG.1 SPE signal notification register 1 SPE.SIG_NOTIFY_REG.2 SPE signal notification register 2
<i>data</i>	The 32-bit data to be written to the specified signal notification register.

Returns

On success, `spe_write_signal` returns 0. On failure, -1 is returned.

`int _base_spe_context_run (spe_context_ptr_t spe, unsigned int * entry, unsigned int runflags, void * argp, void * envp, spe_stop_info_t * stopinfo)`

`_base_spe_context_run` starts execution of an SPE context with a loaded image

Parameters

<i>spectx</i>	Specifies the SPE context
<i>entry</i>	entry point for the SPE program. If set to 0, entry point is determined by the ELF loader.
<i>runflags</i>	valid values are: SPE_RUN_USER_REGS Specifies that the SPE setup registers r3, r4, and r5 are initialized with the 48 bytes pointed to by argp. SPE_NO_CALLBACKS do not use built in library functions.
<i>argp</i>	An (optional) pointer to application specific data, and is passed as the second parameter to the SPE program.
<i>envp</i>	An (optional) pointer to environment specific data, and is passed as the third parameter to the SPE program.

```

3.23.4 Function Documentation

int `_base_spe_event_source_acquire` (struct `spe_context` * *spectx*, enum `fd_name` *fdesc*)

`_base_spe_event_source_acquire` opens a file descriptor to the specified event source

Parameters

<i>spectx</i>	Specifies the SPE context
<i>fdesc</i>	Specifies the event source

void __base_spe_event_source_release (struct spe_context * *spectx*, enum fd_name *fdesc*)

__base_spe_event_source_release releases the file descriptor to the specified event source

Parameters

<i>spectx</i>	Specifies the SPE context
<i>fdesc</i>	Specifies the event source

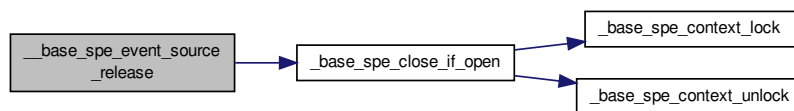

Definition at line 79 of file accessors.c.

References _base_spe_close_if_open().

```

80 {
81     _base_spe_close_if_open(spe, fdesc);
82 }
```

Here is the call graph for this function:

int __base_spe_spe_dir_get (struct spe_context * *spectx*)

__base_spe_spe_dir_get return the file descriptor of the SPE directory in spufs

Parameters

<i>spectx</i>	Specifies the SPE context
---------------	---------------------------

int __base_spe_stop_event_source_get (spe_context_ptr_t *spe*)

__base_spe_stop_event_source_get

Parameters

<i>spectx</i>	Specifies the SPE context
---------------	---------------------------

speevent users read from this end

Definition at line 92 of file accessors.c.

References spe_context::base_private, and spe_context.base_priv::ev_pipe.

```

93 {
94     return spe->base_private->ev_pipe[1];
95 }
```

int __base_spe_stop_event_target_get (spe_context_ptr_t *spe*)

__base_spe_stop_event_target_get

Parameters

<i>spectx</i>	Specifies the SPE context
---------------	---------------------------

speevent writes to this end

Definition at line 100 of file accessors.c.

References spe_context::base_private, and spe_context_base_priv::ev_pipe.

```

101 {
102     return spe->base_private->ev_pipe[0];
103 }
```

void __spe_context_update_event (void)

__spe_context_update_event internal function for gdb notification.

Referenced by _base_spe_context_destroy(), and _base_spe_program_load_complete().

int _base_spe_callback_handler_deregister (unsigned int *callnum*)

unregister a handler function for the specified number NOTE: unregistering a handler from call zero and one is ignored.

Definition at line 78 of file lib_builtin.c.

References MAX_CALLNUM, and RESERVED.

```

79 {
80     errno = 0;
81     if (callnum > MAX_CALLNUM) {
82         errno = EINVAL;
83         return -1;
84     }
85     if (callnum < RESERVED) {
86         errno = EACCES;
87         return -1;
88     }
89     if (handlers[callnum] == NULL) {
90         errno = ESRCH;
91         return -1;
92     }
93
94     handlers[callnum] = NULL;
95     return 0;
96 }
```

void* _base_spe_callback_handler_query (unsigned int *callnum*)

query a handler function for the specified number

Definition at line 98 of file lib_builtin.c.

References MAX_CALLNUM.

```

99 {
100     errno = 0;
101
102     if (callnum > MAX_CALLNUM) {
103         errno = EINVAL;
104         return NULL;
105     }
106     if (handlers[callnum] == NULL) {
107         errno = ESRCH;
108         return NULL;
109     }
110     return handlers[callnum];
111 }
```

int _base_spe_callback_handler_register (void * *handler*, unsigned int *callnum*, unsigned int *mode*)

register a handler function for the specified number NOTE: registering a handler to call zero and one is ignored.

Definition at line 40 of file lib.builtin.c.

References MAX_CALLNUM, RESERVED, SPE_CALLBACK_NEW, and SPE_CALLBACK_UPDATE.

```

41 {
42     errno = 0;
43
44     if (callnum > MAX_CALLNUM) {
45         errno = EINVAL;
46         return -1;
47     }
48
49     switch(mode) {

53             return -1;
54         }
55         if (handlers[callnum] != NULL) {
56             errno = EACCES;
57             return -1;
58         }
59         handlers[callnum] = handler;
60         break;
61
62     case SPE_CALLBACK_UPDATE:
63         if (handlers[callnum] == NULL) {
64             errno = ESRCH;
65             return -1;
66         }
67         handlers[callnum] = handler;
68         break;
69     default:
70         errno = EINVAL;
71         return -1;
72         break;
73     }
74     return 0;
75 }
76 }
```

spe_context_ptr_t _base_spe_context_create (unsigned int *flags*, spe_gang_context_ptr_t *gctx*, spe_context_ptr_t *aff_spe*)

_base_spe_context_create creates a single SPE context, i.e., the corresponding directory is created in SPUFS either as a subdirectory of a gang or individually (maybe this is best considered a gang of one)

Parameters

<i>flags</i>	
<i>gctx</i>	specify NULL if not belonging to a gang
<i>aff_spe</i>	specify NULL to skip affinity information

Definition at line 183 of file create.c.

Here is the call graph for this function:

int _base_spe_context_destroy (spe_context_ptr_t *spectx*)

_base_spe_context_destroy cleans up what is left when an SPE executable has exited. Closes open file handles and unmaps memory areas.

Parameters

<i>spectx</i>	Specifies the SPE context
---------------	---------------------------

Definition at line 418 of file create.c.

References `__spe_context_update_event()`.

```

419 {
420     int ret = free_spe_context(spe);
421     __spe_context_update_event();
422     return ret;
423 }

```

Here is the call graph for this function:

void _base_spe_context_lock (spe_context_ptr_t spe, enum fd_name fd)

_base_spe_context_lock locks members of the SPE context

Parameters

<i>spectx</i>	Specifies the SPE context
<i>fd</i>	Specifies the file

Definition at line 91 of file create.c.

References spe_context::base_private, and spe_context_base_priv::fd_lock.

Referenced by _base_spe_close_if_open(), and _base_spe_open_if_closed().

```

92 {
93     pthread_mutex_lock(&spe->base_private->fd_lock[fdesc]);
94 }
```

int _base_spe_context_run (spe_context_ptr_t spe, unsigned int * entry, unsigned int runflags, void * argp, void * envp, spe_stop_info_t * stopinfo)

_base_spe_context_run starts execution of an SPE context with a loaded image

Parameters

<i>spectx</i>	Specifies the SPE context
<i>entry</i>	entry point for the SPE program. If set to 0, entry point is determined by the ELF loader.
<i>runflags</i>	valid values are: SPE_RUN_USER_REGS Specifies that the SPE setup registers r3, r4, and r5 are initialized with the 48 bytes pointed to by argp. SPE_NO_CALLBACKS do not use built in library functions.
<i>argp</i>	An (optional) pointer to application specific data, and is passed as the second parameter to the SPE program.
<i>envp</i>	An (optional) pointer to environment specific data, and is passed as the third parameter to the SPE program.

int _base_spe_gang_context_destroy (spe_gang_context_ptr_t gctx)

_base_spe_gang_context_destroy destroys a gang context and frees associated resources

Parameters

<i>gctx</i>	Specifies the SPE gang context
-------------	--------------------------------

Definition at line 427 of file create.c.

```

428 {
429     return free_spe_gang_context (gctx);
430 }

```

int _base_spe_image_close (spe_program_handle_t * handle)

_base_spe_image_close unmaps an SPE ELF object that was previously mapped using spe_open_image.

Parameters

<i>handle</i>	handle to open file
---------------	---------------------

Return values

0	On success, spe_close_image returns 0.
-1	On failure, -1 is returned and errno is set appropriately. Possible values for errno: EINVAL From spe_close_image, this indicates that the file, specified by filename, was not previously mapped by a call to spe_open_image.

Definition at line 96 of file image.c.

References spe_program_handle::elf_image, image_handle::map_size, image_handle::speh, and spe_program_handle::toe_shadow.

```

97 {
98     int ret = 0;

118
119     return ret;
120 }

```

spe_program_handle_t* _base_spe_image_open (const char *filename)

_base_spe_image_open maps an SPE ELF executable indicated by filename into system memory and returns the mapped address appropriate for use by the spe_create_thread API. It is often more convenient/appropriate to use the loading methodologies where SPE ELF objects are converted to PPE static or shared libraries with symbols which point to the SPE ELF objects after these special libraries are loaded. These libraries are then linked with the associated PPE code to provide a direct symbol reference to the SPE ELF object. The symbols in this scheme are equivalent to the address returned from the spe_open_image function. SPE ELF objects loaded using this function are not shared with other processes, but SPE ELF objects loaded using the other scheme, mentioned above, can be shared if so desired.

Parameters

<i>filename</i>	Specifies the filename of an SPE ELF executable to be loaded and mapped into system memory.
-----------------	---

Returns

On success, spe_open_image returns the address at which the specified SPE ELF object has been mapped. On failure, NULL is returned and errno is set appropriately.

Possible values for errno include:

EACCES The calling process does not have permission to access the specified file.

EFAULT The filename parameter points to an address that was not contained in the calling process's address space.

A number of other errno values could be returned by the open(2), fstat(2), mmap(2), munmap(2), or close(2) system calls which may be utilized by the spe_open_image or spe_close_image functions.

Here is the call graph for this function:

int _base_spe_in_mbox_status (spe_context_ptr_t spectx)

The `_base_spe_in_mbox_status` function fetches the status of the SPU inbound mailbox for the SPE thread specified by the `speid` parameter. A 0 value is return if the mailbox is full. A non-zero value specifies the number of available (32-bit) mailbox entries.

Parameters

<i>spectx</i>	Specifies the SPE context whose mailbox status is to be read.
---------------	---

Returns

On success, returns the current status of the mailbox, respectively. On failure, -1 is returned.

218 }
```

Here is the call graph for this function:

int _base_spe_in_mbox_write (spe_context_ptr_t spectx, unsigned int mbox_data[], int count, int behavior_flag)

The `_base_spe_in_mbox_write` function writes `mbox_data` to the SPE inbound mailbox for the SPE thread `speid`.

If the behavior flag indicates `ALL_BLOCKING` the call will try to write exactly `count` mailbox entries and block until the write request is satisfied, i.e., exactly `count` mailbox entries have been written.

If the behavior flag indicates `ANY_BLOCKING` the call will try to write up to `count` mailbox entries, and block until the write request is satisfied, i.e., at least 1 mailbox entry has been written.

If the behavior flag indicates `ANY_NON_BLOCKING` the call will not block until the write request is satisfied but instead write whatever is immediately possible and return the number of mailbox entries written.

`spe_stat_in_mbox` can be called to ensure that data can be written prior to calling the function.

Parameters

<i>spectx</i>	Specifies the SPE thread whose outbound mailbox is to be read.
<i>mbox_data</i>	

<i>count</i>	
<i>behavior_flag</i>	ALL_BLOCKING ANY_BLOCKING ANY_NON_BLOCKING

Return values

≥ 0	the number of 32-bit mailbox messages written
-1	error condition and errno is set Possible values for errno: EINVAL spectx is invalid Exxxx what else do we need??

void* _base_spe_ls_area_get (struct spe_context * spectx)

_base_spe_ls_area_get returns a pointer to the start of the memory mapped local store area

Parameters

<i>spectx</i>	Specifies the SPE context
---------------	---------------------------

int _base_spe_ls_size_get (spe_context_ptr_t spe)

_base_spe_ls_size_get returns the size of the local store area

Parameters

<i>spectx</i>	Specifies the SPE context

int _base_spe_mfcio_get (spe_context_ptr_t spectx, unsigned int ls, void * ea, unsigned int size, unsigned int tag, unsigned int tid, unsigned int rid)

The _base_spe_mfcio_get function places a get DMA command on the proxy command queue of the SPE thread specified by speid. The get command transfers size bytes of data starting at the effective address specified by ea to the local store address specified by ls. The DMA is identified by the tag id specified by tag and performed according to the transfer class and replacement class specified by tid and rid respectively.

Parameters

<i>spectx</i>	Specifies the SPE context
<i>ls</i>	Specifies the starting local store destination address.
<i>ea</i>	Specifies the starting effective address source address.
<i>size</i>	Specifies the size, in bytes, to be transferred.
<i>tag</i>	Specifies the tag id used to identify the DMA command.
<i>tid</i>	Specifies the transfer class identifier of the DMA command.

<i>rid</i>	Specifies the replacement class identifier of the DMA command.
------------	--

Returns

On success, return 0. On failure, -1 is returned.

```

int _base_spe_mfcio_getb (spe_context_ptr_t spectx, unsigned int ls, void * ea, unsigned int size, unsigned int tag, unsigned int tid, unsigned int rid)

The `_base_spe_mfcio_getb` function is identical to `_base_spe_mfcio_get` except that it places a `getb` (get with barrier) DMA command on the proxy command queue. The barrier form ensures that this command and all sequence commands with the same tag identifier as this command are locally ordered with respect to all previously issued commands with the same tag group and command queue.

Parameters

<i>spectx</i>	Specifies the SPE context
<i>ls</i>	Specifies the starting local store destination address.
<i>ea</i>	Specifies the starting effective address source address.
<i>size</i>	Specifies the size, in bytes, to be transferred.
<i>tag</i>	Specifies the tag id used to identify the DMA command.
<i>tid</i>	Specifies the transfer class identifier of the DMA command.
<i>rid</i>	Specifies the replacement class identifier of the DMA command.

Returns

On success, return 0. On failure, -1 is returned.

int _base_spe_mfcio_getf (spe_context_ptr_t spectx, unsigned int ls, void * ea, unsigned int size, unsigned int tag, unsigned int tid, unsigned int rid)

The `_base_spe_mfcio_getf` function is identical to `_base_spe_mfcio_get` except that it places a `getf` (get with fence) DMA command on the proxy command queue. The fence form ensure that this command is locally ordered with respect to all previously issued commands with the same tag group and command queue.

Parameters

<i>spectx</i>	Specifies the SPE context
<i>ls</i>	Specifies the starting local store destination address.

<i>ea</i>	Specifies the starting effective address source address.
<i>size</i>	Specifies the size, in bytes, to be transferred.
<i>tag</i>	Specifies the tag id used to identify the DMA command.
<i>tid</i>	Specifies the transfer class identifier of the DMA command.
<i>rid</i>	Specifies the replacement class identifier of the DMA command.

Returns

int _base_spe_mfcio_put (spe_context_ptr_t spectx, unsigned int ls, void * ea, unsigned int size, unsigned int tag, unsigned int tid, unsigned int rid)

The _base_spe_mfcio_put function places a put DMA command on the proxy command queue of the SPE thread specified by speid. The put command transfers size bytes of data starting at the local store address specified by ls to the effective address specified by ea. The DMA is identified by the tag id specified by tag and performed according transfer class and replacement class specified by tid and rid respectively.

Parameters

<i>spectx</i>	Specifies the SPE context
<i>ls</i>	Specifies the starting local store destination address.
<i>ea</i>	Specifies the starting effective address source address.
<i>size</i>	Specifies the size, in bytes, to be transferred.
<i>tag</i>	Specifies the tag id used to identify the DMA command.
<i>tid</i>	Specifies the transfer class identifier of the DMA command.
<i>rid</i>	Specifies the replacement class identifier of the DMA command.

int _base_spe_mfcio_putb (spe_context_ptr_t spectx, unsigned int ls, void * ea, unsigned int size, unsigned int tag, unsigned int tid, unsigned int rid)

The _base_spe_mfcio_putb function is identical to _base_spe_mfcio_put except that it places a putb (put with barrier) DMA command on the proxy command queue. The barrier form ensures that this command and all sequence commands with the same tag identifier as this command are locally ordered with respect to all previously issued commands with the same tag group and command queue.

Parameters

<i>spectx</i>	Specifies the SPE context
<i>ls</i>	Specifies the starting local store destination address.
<i>ea</i>	Specifies the starting effective address source address.
<i>size</i>	Specifies the size, in bytes, to be transferred.
<i>tag</i>	Specifies the tag id used to identify the DMA command.
<i>tid</i>	Specifies the transfer class identifier of the DMA command.
<i>rid</i>	Specifies the replacement class identifier of the DMA command.

Returns

On success, return 0. On failure, -1 is returned.

Definition at line 137 of file dma.c.

References MFC_CMD_PUTB.

```

int _base_spe_mfcio_putf (spe_context_ptr_t spectx, unsigned int ls, void * ea, unsigned int size, unsigned int tag, unsigned int tid, unsigned int rid)

The _base_spe_mfcio_putf function is identical to _base_spe_mfcio_put except that it places a putf (put with fence) DMA command on the proxy command queue. The fence form ensures that this command is locally ordered with respect to all previously issued commands with the same tag group and command queue.

Parameters

<i>spectx</i>	Specifies the SPE context
<i>ls</i>	Specifies the starting local store destination address.
<i>ea</i>	Specifies the starting effective address source address.
<i>size</i>	Specifies the size, in bytes, to be transferred.
<i>tag</i>	Specifies the tag id used to identify the DMA command.
<i>tid</i>	Specifies the transfer class identifier of the DMA command.
<i>rid</i>	Specifies the replacement class identifier of the DMA command.

Returns

On success, return 0. On failure, -1 is returned.

int _base_spe_out_intr_mbox_status (spe_context_ptr_t spectx)

The `_base_spe_out_intr_mbox_status` function fetches the status of the SPU outbound interrupt mailbox for the SPE thread specified by the `speid` parameter. A 0 value is return if the mailbox is empty. A non-zero

value specifies the number of 32-bit unread mailbox entries.

Parameters

<i>spectx</i>	Specifies the SPE context whose mailbox status is to be read.
---------------	---

Returns

On success, returns the current status of the mailbox, respectively. On failure, -1 is returned.

253 }
```

Here is the call graph for this function:

int _base_spe_out_mbox_read (*spe_context_ptr_t spectx*, *unsigned int mbox_data[]*, *int count*)

The `_base_spe_out_mbox_read` function reads the contents of the SPE outbound interrupting mailbox for the SPE thread `speid`.

The call will not block until the read request is satisfied, but instead return up to count currently available mailbox entries.

`spe_stat_out_intr_mbox` can be called to ensure that data is available prior to reading the outbound interrupting mailbox.

Parameters

<i>spectx</i>	Specifies the SPE thread whose outbound mailbox is to be read.
<i>mbox_data</i>	
<i>count</i>	

Return values

<i>>0</i>	the number of 32-bit mailbox messages read
<i>=0</i>	no data available
<i>-1</i>	error condition and errno is set Possible values for errno: EINVAL speid is invalid Exxxx what else do we need??

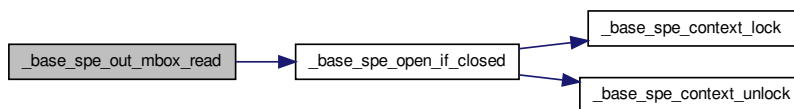

Definition at line 58 of file mbox.c.

void* _base_spe_ps_area_get (struct spe_context * spectx, enum ps_area area)

_base_spe_ps_area_get returns a pointer to the start of memory mapped problem state area

Parameters

<i>spectx</i>	Specifies the SPE context
<i>area</i>	specifies the area to map

int _base_spe_signal_write (spe_context_ptr_t spectx, unsigned int signal_reg, unsigned int data)

The _base_spe_signal_write function writes data to the signal notification register specified by signal_reg for the SPE thread specified by the speid parameter.

Parameters

<i>spectx</i>	Specifies the SPE context whose signal register is to be written to.
<i>signal_reg</i>	Specified the signal notification register to be written. Valid signal notification registers are: SPE_SIG_NOTIFY_REG_1 SPE signal notification register 1 SPE_SIG_NOTIFY_REG_2 SPE signal notification register 2

<i>data</i>	The 32-bit data to be written to the specified signal notification register.
-------------	--

Returns

On success, `spe_write_signal` returns 0. On failure, -1 is returned.

```

Here is the call graph for this function:

int _base_spe_stop_reason_get (spe_context_ptr_t *spectx*)

_base_spe_stop_reason_get

Parameters

<i>spectx</i>	one thread for which to check why it was stopped
---------------	--

Return values

0	success - eventid and eventdata set appropriately
1	spe has not stopped after checking last, so no data was written to event
-1	an error has happened, event was not touched, errno gets set Possible vales for errno: EINVAL speid is invalid Exxxx what else do we need here??

int _base_spe_stop_status_get (spe_context_ptr_t *spectx*)

_base_spe_stop_status_get

Parameters

<i>spectx</i>	Specifies the SPE context
---------------	---------------------------
